

git → distributed version control system

why need git

- * repository
- * 3B project split to the team
- * makes

main branch

branch

new features

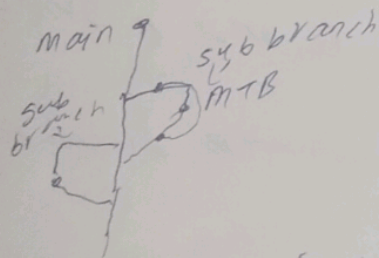

pull request

- * projects as compare version

- * multiple version 3B version
- failure
- previous version
- version

git terms

- Repository (repo) → folder → .git hidden folder
tracking details
- commit means → copy/snapshot
↳ message → dark mode changes
- ↳ id → reset changes
- branch means like copy to work and merge

git creator → Linus

git
system/tool

github
platform/cloud
store code

git use
local repository
my laptop

github is store
remote repository
globally access

git commands

git --version → check version
git config --global user.name 'vicky' ^{username and email}
git config --global user.email 'codeio@gmail.com' ^{name and email}
check username and email
git config user.name or user.email

branch setup

git config --global init.defaultBranch main
git init ← ^{if already git started} empty git repository create local repository only my laptop

folder is file create ~~working~~ @vicky
index.html ← this untrack still not track git

git status → show the details git

git add index.html ← first add to track

git commit -m 'index file first copy' ← save still now code

(root-commit) 209e313 - commit id

index.html no show ✓ and a symbol

git log ← @vicky working lines

multiple file add

git add .

git commit -m 'initial commit'

git log

work exit log

Previous version B2NB

- git log
- git commit B2NB on 919 copy version
- git checkout + shift + C - copy
- wq & exit

- git checkout right click paste it commit 1d

now previous version go

~~readme~~ index is - B2NB 40000
that means that time this commit not
have that file

- git checkout main ← main latest commit
again version with changes commit

- git checkout -s main ← previous commit 1d
changes working
current commit B
B2NB without changes commit

remote repository

- * git hub is 3rd repository create

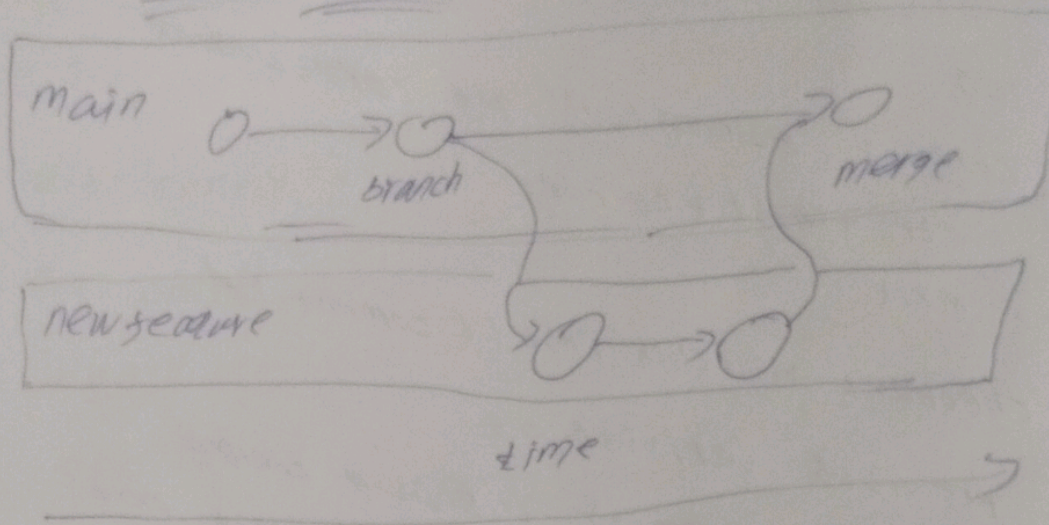

↓ repository link
git remote add origin <https://github.com/codeideemo1911912>

git branch -m main ← this code no need
already create branch

git push -u origin main

so local repository file store → global
repository

branch diagram

create a branch

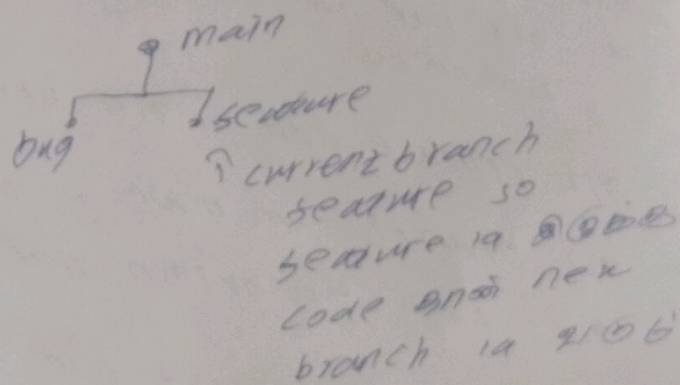

git branch bug

git checkout bug ← bug branch nu bun B

single line branch create and visit

git checkout -b feature branch name

* current th stg branch @@@@B
 git stg copy stg th new
 branch create @@@@

specific th stg my which branch
 is @@@@ new branch @@@@B

git branch new-bug bug
 ↑
 new branch
 bug is @@@@ branch
 create @@@@
 so bug code @@@@

local repo to remote repository
local branch as git hub's origin
push - u origin feature & so
this
git

local branch as git
push -u origin feature & so send
git this branch
↑
upstream
git hub

* 3B Branch git hub @ one time send
Hoon Buno

- * 2133 Branch is not file modified
- * this line only run

this line only run

git add.

```
git add .
git commit -m 'new feature'
```

git push

git commit
git push
new Branch of main Branch or merge
is hard so ↓
and your repo

new Branch of
* comment line is hard sold
the give

new branch of
* comment line is hard to
* go to the git hub and your repo
show compare pull request or

two way show com
PWI request 96 tab click
request

* create pull request in main

* create pull request

* select branch main ← new branch

↑ ↓
this code
are merge
main branch

✓
this code
are merge
main branch

* once review process complete

- * once review
- * merge pull request click
- * sent message

- * merge pull
- * type relevant message
- and click confirm merge

* now new branch code are merge to main branch

merge to main
branches also delete id through
the github

localhost repo is changes branch git pull
↳ incoming merge branch

* git pull ← must give current branch only
2 command must give
 ↓
 fetch + merge together
 remote branch verum na
* git fetch ← overall remote repository
 not available local repo

any conflict merging

new bug branch changes is merged
↳ main branch conflicts
irruky

main → new bug
resolve conflicts
new bug → main

git checkout new-bug

git merge main

CONFLICT message

vs code is highlight branch vi branch
Blue - mean incoming change
Green - current change

* Accept current change

↓
current change only (green)

* Accept incoming change

incoming change only (Blue)

* accept both change

2 BD Blue and green

* compare changes

~|~
Anyone

why conflict comp

- * same file different line edit
 - * Different files edit
 - * same line modify both branch
 - * one branch delete file other edit
 - * both edit same block differently
 - * changes in different lines
- No problem

* And click Resolve in merge editor

* and click complete merge

* code side is green line means incoming changes

then git add.

git commit -m 'redme content merge'

git push

pull request without error

UI use no commands git

* VS code is left side of source control

* click initialised repository

get . add = + changes or staged changes
track panna

show box messages
commit message so give

then click commit button

then show branch
click

show advanced then show private and public repository
your wise click

open on git hub show again

if you want new branch

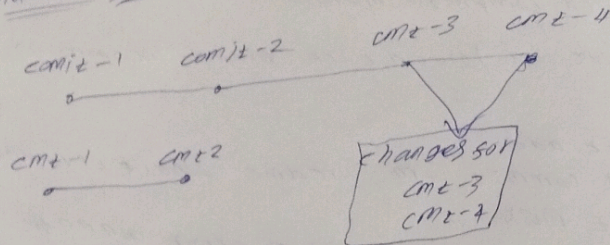

VS code is main click

create branch from click then select
main then give name for new branch

github changes ahn pull panna local repository

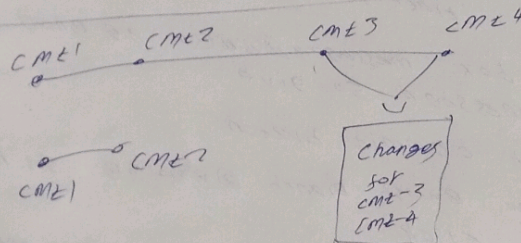

click fetch from all remotes and click pull

Advance topic reset means previous commit & line of code
 91824m2 @ B B B changes delete

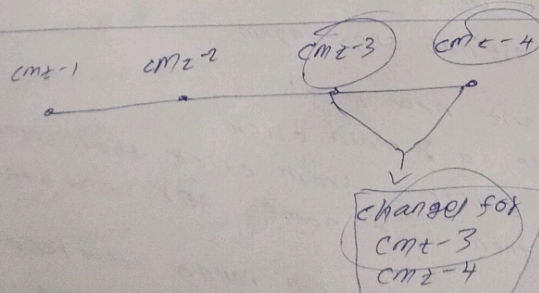

modify
 changes
 means since only changes
 not create commit

↓
 git add, - stage
 git commit

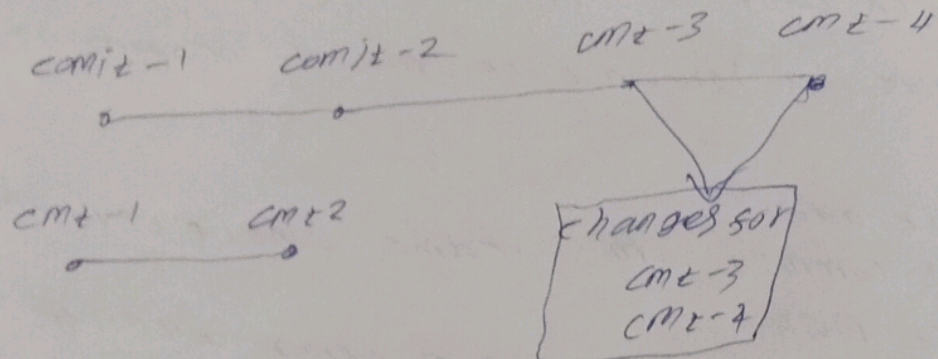

staged means git add,
 no need

○ can
 are
 erase
 delete
 modified
 [staged]

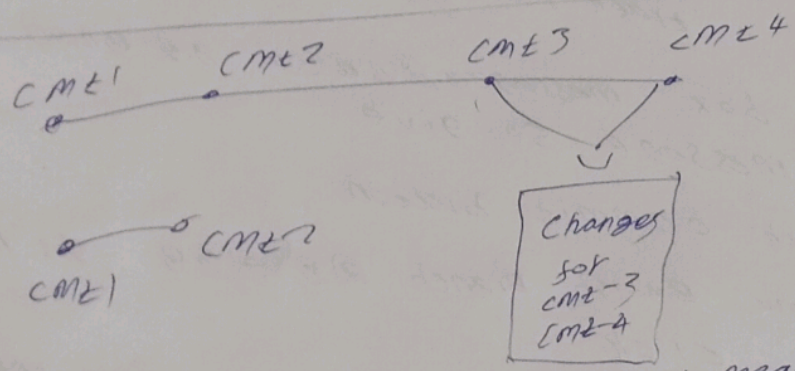

Advance topic

reset $\leftarrow$ means previous commit BLINDLY
 910B14m2 @BBB changes delete

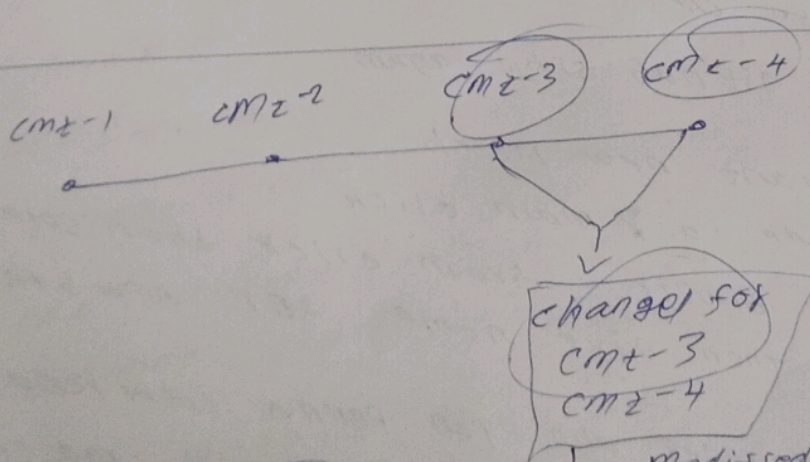

modify
 changes
 means since only changes
 not create commit

↓
 git add, c-stage
 git commit

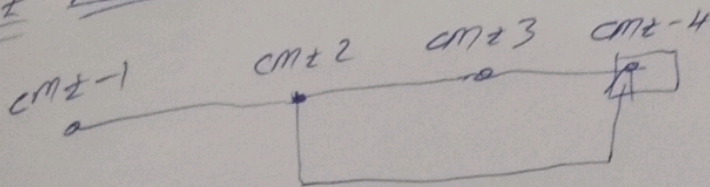

staged means git add.
 no need

○ are
 are
 delete
 [staged]
 modified

git revert

git revert
cm2
id 889c

when use

cm3 - cm4

problem I wish

go cm2

But 1091a @889c
cm3 - cm4 not
remove

git stash means temporary storage

- git stash on stash system

now new task do and git add.
git commit -m 'test'

now i see! stash panna work continue

- git stash list to show all stash system

- git stash apply 'stash@{0}'

stash@{0}
stash list
@889c @1111
2136 id
copy then paste
